

# Complete Asset Management

Ingersoll-Rand Services can help you identify, inventory and manage your mechanical equipment, including heating, ventilation, air conditioning, refrigeration, water filtration/purification and humidification/dehumidification. We can visit your facilities or gather information during service calls to compile a complete equipment inventory along with a baseline evaluation of the condition of your assets. We will then keep electronic records that you can access online.

## Library of Service Histories

You can also have easy web access to a complete data warehouse of service histories on your equipment. This can help you project service needs, identify potential reliability risks, and estimate the expected life of the equipment. In addition, the service history library can be used by service technicians to troubleshoot problems in advance, get the right parts to the job site and speed the process of completing needed repairs. Finally, your data library can help you gather information needed for equipment depreciation.

## Assistance With Compliance

The data available through our asset management tools can help you comply with government regulations, such as Sarbanes-Oxley or the Clean Air Act.
